The graph below shows the relationship between the risk of lung cancer and the duration and intensity of smoking.

Which of the following can be concluded from the graph?

(1) The relative risk of lung cancer increases as the number of years of smoking increases.
(2) The relative risk of lung cancer depends on the number of cigarettes smoked per day.
(3) Quit smoking can reduce the relative risk of lung cancer.

A. (1) only
B. (1) and (2) only
C. (1) and (3) only
D. (2) and (3) only

The building up of plaque on the inner wall of a coronary artery may lead to heart attack because

A. the plaque hardens the arterial wall and so less blood can be pumped out from the heart to the artery.
B. the plaque narrows the lumen of the artery and so less blood returns to the heart.
C. the plaque hardens the arterial wall and so the blood pressure increases.
D. the plaque narrows the lumen of the artery and so less oxygen and nutrient reaches the cardiac muscle.
